

Graffiti protection

# Graffiti-resistant trains for reassured passengers and a profitable service

*Graffiti increases costs for train operators, as it is often expensive, dangerous and time-consuming to clean rolling stock. Euromaint Rail offers graffiti protection using foil – a cost-effective and environmentally-friendly method for preventing and dealing with graffiti.*

# Increase availability with graffiti-resistant trains

*Graffiti protection using foil is an effective method for protecting rolling stock exposed to graffiti. The method also constitutes an environmentally-sound alternative to traditional, environmentally-hazardous graffiti removal. Clean trains in service mean reassured passengers and better profitability.*

## Foil – a tried-and-tested method

Foil is a tried-and-tested method used by several major players internationally. It can be applied or replaced during routine maintenance, and is suitable for all types of vehicles and surfaces, even corrugated surfaces. No special premises are required, and no drying time is required after application.

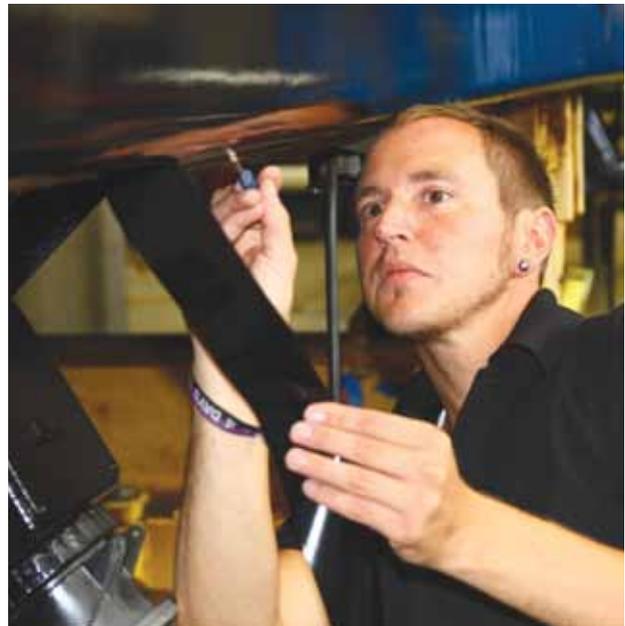

## Unlimited décor with a long service life

The foil has additional areas of application: it is possible to print whatever motifs and colours you want on it. An entire fleet can be reprofiled much faster, with a better finish than traditional paint. If a vehicle is damaged, the foil in the damaged area can simply be replaced, which makes repairing surface damage easier and cheaper.

## Better working environment, shorter cleaning time

When cleaning graffiti off foiled vehicles, there are no special requirements for premises. Cleaning can be done during routine maintenance. Certain graffiti paints do not adhere as well, so cleaning is simple – the graffiti can be wiped off using an environmentally-friendly citrus oil. The procedure is gentle and does not damage the vehicles. The environmental impact is limited to the dirt and substances from the graffiti paint, which are retained in the cloth.

The foil can withstand low temperatures, meaning it can be cleaned outdoors, for example trackside. As the foil repels dirt and brake dust, no oxalic acid is required.

The foil has a guaranteed service life of six years, and can be cleaned innumerable times without losing its ability to repel graffiti and dirt. It also provides excellent protection for clean steel surfaces, which reduces the need for maintenance to tackle oxidation.

## Graffiti protection – the only preventive method on the market

Foil provides better long-term protection than painting. Graffiti-protected surfaces are considerably easier and quicker to clean than painted surfaces, even if these have been given extra graffiti protection. Euromaint Rail offers a complete solution for protection against graffiti, which consists of foil, design, installation, cleaning and any repairs.
