OEM Fabricators, Inc.

A Key Supplier for the Global Rail Maintenance and Passenger Rail Industries

A metal fabricator in the Midwestern United States has developed into a key supplier for the global rail maintenance and passenger rail industries.

Founded in 1986, OEM Fabricators, Inc. built its business by providing contract manufacturing services for local original equipment manufacturers in the Midwestern United States. As a result of OEM's high levels of service and

quality, the company spent its first twenty-five years experiencing rapid growth in its customer base throughout the United States and Canada. In 2012, OEM Fabricators became EN 15085-2 Class 1 certified and has used this certification to support North American and European manufacturers in the rail maintenance industry and develop into a key supplier in the passenger rail industry. In 2018, OEM Fabricators Inc. was awarded a North American Supplier of the Year Award from a global rail manufacturer. In addition, as a

testament to the work supporting European manufacturers, in 2020, OEM Fabricators was proud to receive the Excellence in Services Award from the German American Chamber of Commerce-Midwest.

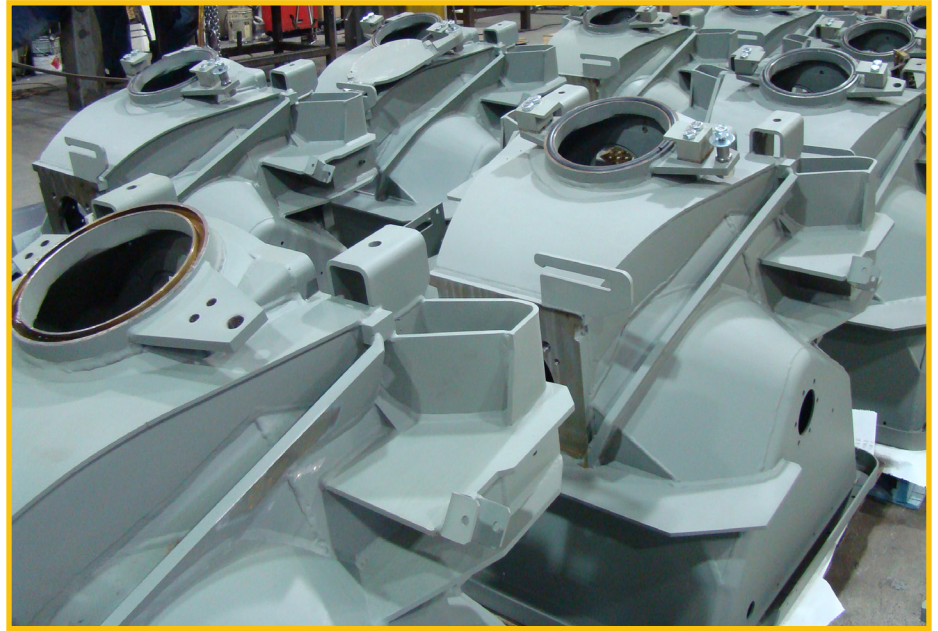

Services Offered

OEM Fabricators, Inc. has a team of highly skilled craftsmen and women building products for leading manufacturers in the oil and gas, construction, mining, rail maintenance and passenger

rail industries. OEM Fabricators provides contract manufacturing services including design assistance, fabrication, welding, machining, painting, and light assembly. The company's strength is complex medium to large-sized components. Examples of products built are structural frames, work head components, underframes, bogey frames, coupler components, tanks and assorted large battery / hydraulic / electrical boxes.

EN Welding

In 2012, after serving the rail maintenance industry for twenty years, OEM Fabricators became EN-certified to build components for a customer exporting rail maintenance machines from the United States to Europe. Since that project, the company's highly skilled team of welders and weld engineers have completed numerous projects either to EN standards for export to Europe, or for European manufacturers setting up localised production in the United States to service the North

Train & Component Overhaul & Maintenance

American market and to meet Buy America requirements. Today, OEM Fabricators is one of a small number of contract manufacturers in the United States offering EN 15085-2 Class 1 certified welding.

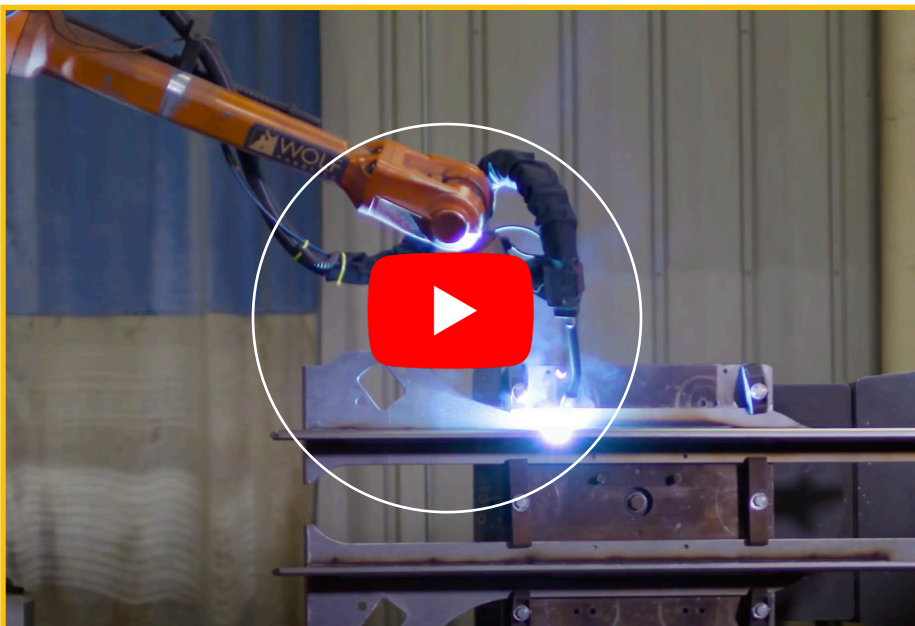

With over twenty years of experience working with European companies, OEM Fabricators is one of a few full-service (machining, welding and painting) suppliers in the United States with a deep understanding of European material

grades, tolerance standards, weld standards and testing standards.

OEM Fabricators has the ability to produce product according to the original European market design, as well as help its customers navigate through the differences between standards, meaning that the learning curve is reduced and the company can serve as a valuable asset for its customers.

Moving Forward

OEM Fabricators, Inc.'s team stands ready to support these markets and is excited to be part of the growing passenger rail market in the United States. Representatives will be visiting InnoTrans 2022 and would appreciate the opportunity to introduce our organisation to you!
